

Nortel Networks

A more modern approach to presentations was essential when retrofitting Nortel Networks boardroom. Nortel –one of the global internet and communications leaders – uses the room for sales presentations, and requested an update of its presentation and audioconferencing equipment.

The audio-visual system consists of a ceiling-mounted LCD projector, wall-mounted speakers, and a screen that drops down from the ceiling. The control system contains a VCR, mixer, amplifier and a satellite receiver. This equipment is stored in a cabinet along the wall and is on a rack custom-designed to pull out for easy access and maintenance. The room also has a document camera which is used to show information system planning diagrams. The intuitive touchscreen panel controls all of these functions.

The room is further enhanced with an audioconferencing system (located in the center of the table) that allows participants to talk and listen at the same time with no clipping or distortion. Add-on microphones and wallmounted speakers complete the superior audio package.
